Application backup recovery - operating guide

CURRENT 2026; effective 1 August 2026

Scope: Platform custodians, restore drills and retained recovery points. This is fictional Meridian Works guidance. The following responsibilities apply only to the named activity, not to other procedures with similar labels.

Only a platform recovery custodian may restore a saved tenant folder after accidental deletion.

Job code BAK-298 requires verification of the snapshot catalogue; BAK-289 indicates a completed checksum pass.

The coordinator records what actually happened, identifies the responsible owner and checks the applicable route. A similarly numbered form is not interchangeable with the recorded form. For a rejected submission, retain the original request and obtain corrected evidence rather than creating a replacement event.

Registry BAK-399: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-410: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-421: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-432: record the request in the pending owner-verification queue; this entry is not the named exception route.

Application backup recovery - operating guide

CURRENT 2026; effective 1 August 2026

Eligibility and operational limits. Select the named cohort and activity before applying a period or amount; different entitlements in this section are not substitutes.

Tenant data snapshots are retained for thirty-five days, while synthetic drill snapshots are retained for seven days.

The backup schedule permits no more than four hours between successful application backups.

A valid request contains its underlying event date and the scope used for the calculation. Reviewers distinguish acknowledgement, completion and storage periods. A deadline for submitting evidence is not a service restoration promise. If the activity or group is not stated, escalate the question rather than borrowing a nearby rule.

Registry BAK-443: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-454: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-465: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry BAK-476: record the request in the pending owner-verification queue; this entry is not the named exception route.

Application backup recovery - operating guide

CURRENT 2026; effective 1 August 2026

Document control: this 2026 operating guide is CURRENT and effective from 1 August 2026. The 2024 edition is archived and superseded. No forecast for a later year is stated.

The effective 2026 recovery schedule retains tenant snapshots for thirty-five days.

Restore authorisation and snapshot retention belong to the recovery guide; transfer limits belong to the network annex.

The reference annex has its own scope. Staff should distinguish operational permission from commercial price, evidence retention and service specifications. Publication of a code or a process owner does not create a missing technical limit or a financial guarantee.

Amendment log: this edition consolidates the current timing rule and ownership path. Historical examples remain in the archive for traceability. They are not exceptions to the current rule. A request citing an older edition must be checked against the effective document before execution.
