International goods returns - operating guide

CURRENT 2026; effective 1 August 2026

Scope: Shipping coordinators and customs return evidence. This is fictional Meridian Works guidance. The following responsibilities apply only to the named activity, not to other procedures with similar labels.

A shipping clerk establishes that a return is the previously exported item by using the original serial-number export record.

CUS-569 declares a repair-and-return shipment; CUS-596 declares a permanent import.

The coordinator records what actually happened, identifies the responsible owner and checks the applicable route. A similarly numbered form is not interchangeable with the recorded form. For a rejected submission, retain the original request and obtain corrected evidence rather than creating a replacement event.

Registry CUS-670: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-681: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-692: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-703: record the request in the pending owner-verification queue; this entry is not the named exception route.

International goods returns - operating guide

CURRENT 2026; effective 1 August 2026

Eligibility and operational limits. Select the named cohort and activity before applying a period or amount; different entitlements in this section are not substitutes.

A repaired return declares repair value, whereas a new replacement declares full item value.

The broker must receive repair-return evidence seventy-two hours before collection.

A valid request contains its underlying event date and the scope used for the calculation. Reviewers distinguish acknowledgement, completion and storage periods. A deadline for submitting evidence is not a service restoration promise. If the activity or group is not stated, escalate the question rather than borrowing a nearby rule.

Registry CUS-714: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-725: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-736: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry CUS-747: record the request in the pending owner-verification queue; this entry is not the named exception route.

International goods returns - operating guide

CURRENT 2026; effective 1 August 2026

Document control: this 2026 operating guide is CURRENT and effective from 1 August 2026. The 2024 edition is archived and superseded. No forecast for a later year is stated.

The return shipping instruction active in 2026 requires a seventy-two-hour broker lead time.

Customs evidence and commercial courier surcharges answer different parts of a shipment request.

The reference annex has its own scope. Staff should distinguish operational permission from commercial price, evidence retention and service specifications. Publication of a code or a process owner does not create a missing technical limit or a financial guarantee.

Amendment log: this edition consolidates the current timing rule and ownership path. Historical examples remain in the archive for traceability. They are not exceptions to the current rule. A request citing an older edition must be checked against the effective document before execution.
