Software seat allocation - operating guide

CURRENT 2026; effective 1 August 2026

Scope: Enterprise licence administrators and named-user products. This is fictional Meridian Works guidance. The following responsibilities apply only to the named activity, not to other procedures with similar labels.

A replacement analyst must receive a reassigned named seat and cannot reuse a departing user's sign-in.

SKU NOVA-458 includes offline analysis access; SKU NOVA-485 includes browser-only reporting.

The coordinator records what actually happened, identifies the responsible owner and checks the applicable route. A similarly numbered form is not interchangeable with the recorded form. For a rejected submission, retain the original request and obtain corrected evidence rather than creating a replacement event.

Registry NOVA-559: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-570: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-581: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-592: record the request in the pending owner-verification queue; this entry is not the named exception route.

Software seat allocation - operating guide

CURRENT 2026; effective 1 August 2026

Eligibility and operational limits. Select the named cohort and activity before applying a period or amount; different entitlements in this section are not substitutes.

Concurrent lab seats allow one simultaneous device; named analyst seats allow two simultaneous devices.

An analyst licence enters reclaim review after forty-two consecutive unused days.

A valid request contains its underlying event date and the scope used for the calculation. Reviewers distinguish acknowledgement, completion and storage periods. A deadline for submitting evidence is not a service restoration promise. If the activity or group is not stated, escalate the question rather than borrowing a nearby rule.

Registry NOVA-603: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-614: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-625: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry NOVA-636: record the request in the pending owner-verification queue; this entry is not the named exception route.

Software seat allocation - operating guide

CURRENT 2026; effective 1 August 2026

Document control: this 2026 operating guide is CURRENT and effective from 1 August 2026. The 2024 edition is archived and superseded. No forecast for a later year is stated.

The seat policy effective in 2026 uses a forty-two-day reclaim inactivity window.

Seat allocation answers entitlement questions. Prices and billing currency remain commercial terms.

The reference annex has its own scope. Staff should distinguish operational permission from commercial price, evidence retention and service specifications. Publication of a code or a process owner does not create a missing technical limit or a financial guarantee.

Amendment log: this edition consolidates the current timing rule and ownership path. Historical examples remain in the archive for traceability. They are not exceptions to the current rule. A request citing an older edition must be checked against the effective document before execution.
