# Digital wallet dispute handling - operating guide

CURRENT 2026; effective 1 August 2026

Scope: Payments operations and evidence intake. This is fictional Meridian Works guidance. The following responsibilities apply only to the named activity, not to other procedures with similar labels.

Before changing an account after an unfamiliar wallet purchase, the operator preserves the transaction evidence bundle.

PAY-814 classifies a duplicate merchant capture; PAY-841 classifies a delayed refund notification.

The coordinator records what actually happened, identifies the responsible owner and checks the applicable route. A similarly numbered form is not interchangeable with the recorded form. For a rejected submission, retain the original request and obtain corrected evidence rather than creating a replacement event.

Registry PAY-915: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-926: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-937: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-948: record the request in the pending owner-verification queue; this entry is not the named exception route.

CURRENT 2026; effective 1 August 2026

Eligibility and operational limits. Select the named cohort and activity before applying a period or amount; different entitlements in this section are not substitutes.

Duplicate-capture reviews are due within two working days; refund-status enquiries allow four working days.

Customers may submit duplicate-capture evidence within twenty-eight calendar days of the transaction.

A valid request contains its underlying event date and the scope used for the calculation. Reviewers distinguish acknowledgement, completion and storage periods. A deadline for submitting evidence is not a service restoration promise. If the activity or group is not stated, escalate the question rather than borrowing a nearby rule.

Registry PAY-959: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-970: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-981: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry PAY-992: record the request in the pending owner-verification queue; this entry is not the named exception route.

# Digital wallet dispute handling - operating guide

CURRENT 2026; effective 1 August 2026

Document control: this 2026 operating guide is CURRENT and effective from 1 August 2026. The 2024 edition is archived and superseded. No forecast for a later year is stated.

The wallet procedure currently effective in 2026 provides a twenty-eight-calendar-day evidence window.

Operational case classification cannot determine fraud or tariff terms absent from the merchant service tariff.

The reference annex has its own scope. Staff should distinguish operational permission from commercial price, evidence retention and service specifications. Publication of a code or a process owner does not create a missing technical limit or a financial guarantee.

Amendment log: this edition consolidates the current timing rule and ownership path. Historical examples remain in the archive for traceability. They are not exceptions to the current rule. A request citing an older edition must be checked against the effective document before execution.
