Warehouse spill response - operating guide

CURRENT 2026; effective 1 August 2026

Scope: Distribution workers, chemical zones and safety isolation. This is fictional Meridian Works guidance. The following responsibilities apply only to the named activity, not to other procedures with similar labels.

On discovering a leaking drum beside a loading lane, staff cordon the lane and notify the shift safety lead before cleanup.

SAFE-631 documents a non-injury chemical spill; SAFE-613 documents a forklift contact event.

The coordinator records what actually happened, identifies the responsible owner and checks the applicable route. A similarly numbered form is not interchangeable with the recorded form. For a rejected submission, retain the original request and obtain corrected evidence rather than creating a replacement event.

Registry SAFE-732: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-743: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-754: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-765: record the request in the pending owner-verification queue; this entry is not the named exception route.

Warehouse spill response - operating guide

CURRENT 2026; effective 1 August 2026

Eligibility and operational limits. Select the named cohort and activity before applying a period or amount; different entitlements in this section are not substitutes.

A solvent release requires a six-metre cordon; a water leak requires a two-metre cordon.

The shift safety lead must receive a spill notification within ten minutes of discovery.

A valid request contains its underlying event date and the scope used for the calculation. Reviewers distinguish acknowledgement, completion and storage periods. A deadline for submitting evidence is not a service restoration promise. If the activity or group is not stated, escalate the question rather than borrowing a nearby rule.

Registry SAFE-776: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-787: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-798: record the request in the pending owner-verification queue; this entry is not the named exception route.

Registry SAFE-809: record the request in the pending owner-verification queue; this entry is not the named exception route.

Warehouse spill response - operating guide

CURRENT 2026; effective 1 August 2026

Document control: this 2026 operating guide is CURRENT and effective from 1 August 2026. The 2024 edition is archived and superseded. No forecast for a later year is stated.

The operative 2026 spill procedure sets the solvent cordon radius at six metres.

The response card governs isolation. Material disposal codes are maintained in the waste classification annex.

The reference annex has its own scope. Staff should distinguish operational permission from commercial price, evidence retention and service specifications. Publication of a code or a process owner does not create a missing technical limit or a financial guarantee.

Amendment log: this edition consolidates the current timing rule and ownership path. Historical examples remain in the archive for traceability. They are not exceptions to the current rule. A request citing an older edition must be checked against the effective document before execution.
